XP Core Values and How We Followed Them

1. Communication

The team ensures that communication flows outward from the Restaurant Finder application development. To stay aligned, they stayed gated from tools like GitHub, Slack, and video conferencing. We had weekly scrum meetings to talk through progress, challenges and tasks for the coming week to encourage transparency and collaboration. All team members had clear documentation of the APIs, database structures, and user stories, which helped everyone understand what they were creating and doing. In the project journal, team members also shared frequent updates, which meant there was accountability and less miscommunication.

2. Feedback

The project's iterative development process was centered on feedback. Regular code reviews It helped refine quality APIs and UI design as well as catch errors early. The team used sessions to identify pain points in the user experience and refine the features such as search functionality and map integration. At the end of each sprint, retrospectives were held. Team members offered constructive feedback on processes, and where processes could be improved. Overall, they seek improvement in collaboration and task management.

On the other hand, the team made sure to foster communication explicitly, and by The RestaurantFinder application possessed its functional requirements while still maintaining high standards.
